

Life WASTE4GREEN:

Sustainable and Green Agri-Waste Based Biopesticides

Drs. Azucena González Coloma and María Fe Andrés Yeves will give an online seminar about the Life Project WASTE 4 GREEN and its latest results.

The project aims to mitigate adverse effects on Environment and Human Health of chemical origin pesticides, currently used in stone fruit crops protection.

The efficacy of two natural, safe and sustainable new formulations is currently being demonstrated. The raw materials have been obtained from agro-industrial by-products that will allow us to replace chemical pesticides used at present in stone fruit crops.

The resulting formulates may be applied under similar circumstances in other countries of the European Union, on other stone fruit and horticultural crops.
